SUMMARY

Senior Product Engineer who takes products from ambiguity to production — owning the full surface: data model, API design, user-facing UI, and production monitoring. Builds the tools that build: platforms and workflows that multiply the output of engineers and AI agents. 5+ years of experience, including 4 on a global B2B SaaS serving 30+ enterprise clients (billion-dollar companies among them); promoted from intern to senior in under 4 years. Co-founded and launched a travel-tech product 0→1. Ships production AI features, not prototypes.

TECHNICAL SKILLS

Frontend: React, Next.js, TypeScript, JavaScript, HTML/CSS

Backend: Go, Python, Node.js, REST APIs, Microservices, SDKs, Background Workers

Data: PostgreSQL, Prisma, Redis, Apache Kafka, ETL, Data Pipelines

AI: LLM Integrations, RAG Systems, Multi-Step LLM Workflows, AI-Powered Product Features

Cloud & Ops: AWS (ECS, Lambda, S3, RDS, SQS), Docker, Cloudflare, Prometheus, Grafana, CI/CD

EXPERIENCE

VE3 — Enterprise Data Platform (B2B SaaS)

Senior Product Engineer — Full Stack | Aug 2022 - Present | Remote

Promoted 3× in 4 years: Intern (2022) → Junior (2023) → Mid-level (2024) → Senior (2025)

- Own product surfaces end-to-end for 30+ enterprise clients, including billion-dollar global companies — from data model and backend services to customer-facing analytics integrations.
- Cut customer-facing dashboard load times by 75% and query load by 50× through PostgreSQL optimization — directly improving the daily experience of enterprise users.
- Shipped a production RAG system and now building its interactive in-product AI interface — full AI feature ownership from spec to production, backend to UI.
- Drive architectural decisions for platform services and AI features; technical direction adopted across the team.
- Architected REST APIs, SDKs, and Go/Python microservice orchestration for high-volume, multi-tenant workflows — the technical bridge between the platform and enterprise customers.
- Built workers, queues, scheduled jobs, and data pipelines on AWS powering a forecasting platform that runs 25+ predictive models over millions of records.
- Implemented full production observability with Prometheus, Grafana, and CloudWatch; mentor engineers on Go, Python, and system design.

Self-Employed — Software Developer | Feb 2021 - Aug 2022 | Remote

- Delivered production web applications and Python automation for clients, eliminating recurring manual operational work.

PROJECTS

Plan Patagonia — Co-founder (0→1) • TypeScript, Next.js, React, Prisma, Neon Postgres, Docker, S3, Cloudflare, Claude API

- Co-founded a travel-tech product that turns scattered forums, blogs, and guesswork into one place to plan a Patagonia trek — weather-aware where it matters most, so travelers make the most of the trip. Architecting and building the entire platform 0→1: product engineering, AI integrations, SEO infrastructure, and business strategy.

Workflow Execution Engine (wee) — Open Source • Go, JSON Schema, CLI, LLM APIs • github.com/tzpereira/workflow-execution-engine

- Engineering processes live in docs and people's heads — WEE turns them into versioned, replayable, budgeted pipelines for humans and AI agents. DAG runtime, schema-enforced output contracts, cost budgets, replay, event-based observability. The engine owns the loops, not the model. Single static Go binary.

Kafka Go SDK — Open Source • Go, Apache Kafka • github.com/tzpereira/go-kafka-sdk

- Every Kafka service re-implements connection, retry, and error handling — this SDK packages those patterns once, safe by default, so services ship events instead of plumbing.
