SUMMARY

Senior product engineer, full stack, with 5+ years shipping software. I take products from a vague idea all the way to production, and I own the whole surface: the data model, the API, the UI people actually touch, and the monitoring that tells me when something breaks. Four of those years were on a global B2B SaaS serving 30+ enterprise clients, some of them billion-dollar companies. I started as an intern there and made senior in under four years. On the side I co-founded a travel-tech product and took it from zero to launch. The AI features I build run in production, not in a demo folder.

TECHNICAL SKILLS

Frontend: React, Next.js, TypeScript, JavaScript, HTML/CSS

Backend: Go, Python, Node.js, REST APIs, Microservices, SDKs, Background Workers

Data: PostgreSQL, Prisma, Redis, Apache Kafka, ETL, Data Pipelines

AI: LLM Integrations, RAG Systems, Multi-Step LLM Workflows, AI-Powered Product Features

Cloud & Ops: AWS (ECS, Lambda, S3, RDS, SQS), Docker, Cloudflare, Prometheus, Grafana, CI/CD

EXPERIENCE

VE3 — Enterprise Data Platform (B2B SaaS)

Senior Product Engineer — Full Stack | Aug 2022 – Present | Remote

Promoted three times in four years: Intern (2022) → Junior (2023) → Mid-level (2024) → Senior (2025)

- Own product surfaces **end to end for 30+ enterprise clients**, billion-dollar companies among them, from the data model and backend services down to the analytics integrations customers see every day.
- Cut customer-facing dashboard load times by **75%** and query load by **50x** through PostgreSQL optimization, which changed how enterprise users experience the product daily.
- Shipped a **RAG system into production** and am now building the in-product AI interface on top of it. I own the feature from spec to production, backend to UI.
- Make the **architecture calls** for platform services and AI features; the technical direction I set gets adopted across the team.
- Built **REST APIs, SDKs, and Go/Python microservice orchestration** for high-volume, multi-tenant workflows, the layer that connects the platform to enterprise customers.
- Built the **workers, queues, scheduled jobs, and data pipelines on AWS** behind a forecasting platform that runs **25+ predictive models** over millions of records.
- Set up **full production observability** with Prometheus, Grafana, and CloudWatch, and mentor other engineers on Go, Python, and system design.

Self-Employed — Software Developer

Feb 2021 – Aug 2022 | Remote

- Built production web apps and Python automation for clients, cutting out recurring manual work they had been doing by hand.

PROJECTS

Plan Patagonia — Co-founder (0 → 1) · TypeScript, Next.js, React, Prisma, Neon Postgres, Docker, S3, Cloudflare, Claude API

- Co-founded a travel-tech product that pulls scattered forums, blogs, and guesswork into one place to plan a Patagonia trek, and makes it weather-aware where that matters most so travelers get the most out of the trip. I architect and build the whole platform 0 → 1: product engineering, AI integrations, SEO infrastructure, and business strategy.

Workflow Execution Engine (wee) — Open Source · Go, JSON Schema, CLI, LLM APIs · github.com/tzpereira/workflow-execution-engine

- Engineering processes usually live in docs or in someone's head. WEE turns them into versioned, replayable, budgeted pipelines for both humans and AI agents: a DAG runtime, schema-enforced output contracts, cost budgets, replay, and event-based observability. The engine owns the loops, not the model. Ships as a single static Go binary.

Kafka Go SDK — Open Source · Go, Apache Kafka · github.com/tzpereira/go-kafka-sdk

- Every Kafka service ends up reimplementing connection, retry, and error handling. This SDK packages those patterns once, safe by default, so services ship events instead of plumbing.
